

# Shelter Shutters

US Pat. NO. 9,243,445

## Measuring Instructions

### Multi Fold Shutter for "Flat Door" or "flush molding around the glass"

A "Flat Door" is what we call a door that has flush molding surrounding the glass. There is a molding that holds the glass in a door in place but sometimes that molding is completely recessed or flush with the door surface. That's a "Flat Door".

#### #1 Measure the glass width

Measure the glass width. The shutter will be installed on the hinge side of the door inside the room.

#### #2 Measure the glass length

Measure the glass length. When measuring the length make sure there is ample space above and below for the shutter to overlap the glass by at least one inch on top and bottom. Our standard is 3" total overlap, 1.5" on top and bottom.

#### #3 Measure the door width

Measure the total width of the door. We will calculate the width of the shutter. Typically we make the shutter wide enough to install it about 1" from the hinge side of the door. If your window is 16" wide or less, all the glass will be exposed when shutter is retracted. On wider door glass, some glass will be covered.

When only glass measurements are supplied we make your shutter 3" longer than the glass. Be aware of magnet locations inside the shutter, that is where the steel adhesive plates will be installed to hold the shutter closed over the glass. **If you need the shutter to be shorter to fit inside restrictions, please supply that exact measurement accurate to 1/8"**

# CUSTOM SHELTER SHUTTERS

## MEASURE FORM (center glass) no raised molding

Shelter Shutters are reversible so the same shutter can install on the left or right side of the door, always on the hinge side
