

Measuring Instructions

Single Fold Shutter for "Flat Door" or "flush vision panel"

A "Flat Door" is what we call a door that has no raised molding surrounding the glass (the molding is flush with the door surface). There is a molding that holds the glass in a door in place but sometimes that molding is completely recessed or flush with the door surface. That's what we call a "Flat Door".

#1. Measure width of glass

Measure glass width.

#2. Add about 3 inches to glass width if possible

Add about two and three inches for your shutter width if possible. *Be sure to overlap the window WIDTH enough for the steel plates that come with the shutter to be mounted onto a flat area.*

#3. Measure length of glass

Measure length of the glass from top to bottom.

#4. Add 2" to 3" inches to length of the glass

Add 2" to 3" to the length of the glass for shutter size if possible.
EXAMPLE: 24" glass length should have 26" to 27" shutter length.

CUSTOM SHELTER SHUTTERS

MEASURE FORM (left or right glass)

Shelter Shutters are reversible so the same shutter can work on a left or right side vision panel
