

## Retail Pricing for Sidelights

Your shutter sizes should include the inside frame measurements plus 3 inches added to the length and 3 inches added to the width. The extra 3 inches will overlap onto the steel frame around the glass, which will be 1 ½ inches on all four sides.

The width of both sections should be the same but the length of each section can be different.

We suggest the top and bottom be made separate. The area next to classroom doors is often a location for waste buckets or other items that may need to be moved to operate the shutter. By making a separate shutter for the bottom, you have options.

Alternatively, you can measure the two sections to be covered with one shutter

### Flat Shutter Size Up to 16" Wide

Length up to 21"...\$85

Length up to 29"...\$90

Length up to 45"...\$117

Length up to 76"...\$135
